

STORMSENTRY™

StormSentry™

Strategy & Analysis Combined
for Flood Protection

HOW IT WORKS

StormSentry™ is an extension of our technology for flood protection & mitigation practices. Using a modified field design, we are able to strategically place field units to capture & correlate flooding activity with designated storm events.

Monitoring manholes during storm events, SmartCover notifications enable the timely deployment of personnel at the most critical points of a collection system or stormwater management network.

SmartCover provides real-time network visibility during storm events, allowing utilities to optimize response times and ensure resilience when facing severe storm activity. StormSentry provides insights that drive decisions to avoid flooding, as well as longer-term decision-making around optimal infrastructure upgrades.
